# Graphing Lines!

**Minds on**

# Graphing Lines!

Rearrange into  $y = mx + b$  form, or determine the intercepts.

$$\begin{array}{r}
 -10x - 5y + 20 = 0 \\
 \phantom{-10x} + 5y \phantom{+ 20} + 5y \\
 \hline
 5y = \frac{-10x + 20}{5} \\
 y = -2x + 4
 \end{array}$$

Expand and rearrange or make a table of values.

$$\begin{array}{r}
 \cancel{-5(y + 2x - 4)} = 0 \\
 \hline
 \phantom{-5} \phantom{+ 2x} - 4 \\
 \phantom{-5} \phantom{+ 2x} - 5 \\
 \hline
 y + 2x - 4 = 0 \\
 - 2x + 4 \phantom{= 0} - 2x \\
 \hline
 y = -2x + 4 \phantom{= 0} + 4
 \end{array}$$

**Minds on**

## Graphing Lines!

What do we notice about the graphs of the 4 lines?

**The graphs are all the same!**

What does this mean about the equation of each line?

**Minds on**

## Graphing Lines!

Let's write each equation as a function of  $x$  and see what happens!

$$y = -2x + 4$$

$$f(x) = -2x + 4$$

$$4x + 2y = 8$$

$$f(x) = -2x + 4$$

$$-10x - 5y + 20 = 0$$

$$f(x) = -2x + 4$$

$$-5(y + 2x - 4) = 0$$

$$f(x) = -2x + 4$$

**Action!**

## Equivalent Algebraic Expressions

Two polynomial functions or algebraic expressions are equivalent if:

- They simplify algebraically to give the same function or expression
- They produce the same graph
- They are equal for all values in the domain

Two polynomial functions or algebraic expressions are **not** equivalent if:

- They fully simplify algebraically to give a **different** function or expression
- They produce a **different** graph
- They are not equal for ANY value in the domain

**Action!**

## Adding and Subtracting Polynomials

Simplify each expression and determine if they are equivalent.

$$\begin{aligned}
 \text{a. } & (2x^2 - 3x + 4) - (3x^2 - 4x) + 3(2x^2 + 5x - 9) \\
 & = \cancel{2x^2} - \cancel{3x} + 4 - \cancel{3x^2} + \cancel{4x} + \cancel{6x^2} + \cancel{15x} - \cancel{27} \\
 & = \underline{5x^2} + 16x - 23
 \end{aligned}$$

---

$$\begin{aligned}
 \text{b. } & x(3x - 5) - 2(-4x^2 + 6x + 15) - (6x^2 - x - 7) \\
 & = \cancel{3x^2} - 5x + \cancel{8x^2} - 12x - 30 - \cancel{6x^2} + x + 7 \\
 & = \underline{5x^2} - 16x - 23
 \end{aligned}$$

Not equivalent!

**Action!**

## Equivalent Algebraic Expressions

$$f(t) = (-5t^2 + 100t + 1000) - (-5t^2 + 75t + 1200)$$

$$g(t) = 10t - 200$$

Are  $f(t)$  and  $g(t)$  equivalent functions?

## Action!

### Adding and Subtracting Polynomials

$$f(t) = (-5t^2 + 100t + 1000) - (-5t^2 + 75t + 1200)$$

$$g(t) = 10t - 200$$

Are  $f(t)$  and  $g(t)$  equivalent functions?

## "Two" methods

### 1. Simplify and Compare

$$\begin{aligned}
 f(t) &= (-5t^2 + 100t + 1000) - (-5t^2 + 75t + 1200) \\
 &= \cancel{-5t^2} + \cancel{100t} + \cancel{1000} + \cancel{5t^2} - \cancel{75t} - \cancel{1200} \\
 &= 25t - 200
 \end{aligned}$$

$$g(t) = 10t - 200$$

$\therefore f(t)$  is not equivalent to  $g(t)$

## Action!

### Adding and Subtracting Polynomials

$$f(t) = (-5t^2 + 100t + 1000) - (-5t^2 + 75t + 1200)$$

$$g(t) = 10t - 200$$

Are  $f(t)$  and  $g(t)$  equivalent functions?

## "Two" methods

### 2. Substitute numerical values for variable(s)

$$f(t) = (-5t^2 + 100t + 1000) - (-5t^2 + 75t + 1200)$$

$$f(0) = (1000) - (1200)$$

$$= -200$$

$$g(t) = 10t - 200$$

$$g(0) = -200$$

$f(0) = g(0)$  so the functions may be equivalent

$$f(t) = (-5t^2 + 100t + 1000) - (-5t^2 + 75t + 1200)$$

$$f(1) = (-5 + 100 + 1000) - (-5 + 75 + 1200)$$

$$= 1095 - (1270)$$

$$= -175$$

$$g(t) = 10t - 200$$

$$g(1) = 10 - 200$$

$$= -190$$

$\neq$

$f(1) \neq g(1)$  and  
 $\therefore$  the expressions are not equivalent.

## Action!

### Equivalent Algebraic Expressions

Are the expressions  $xy + xz + yz$  and  $x^2 + y^2 + z^2$  equivalent?

$$xy + xz + yz$$

$$x^2 + y^2 + z^2$$

When  $x=0, y=0, z=0$

$$(0)(0) + (0)(0) + (0)(0) \\ = 0$$

$$0^2 + 0^2 + 0^2 \\ = 0$$

When  $x=1, y=1, z=1$

$$(1)(1) + (1)(1) + (1)(1) \\ = 1 + 1 + 1 \\ = 3$$

$$(1)^2 + (1)^2 + (1)^2 \\ = 1 + 1 + 1 \\ = 3$$

Let's try  $x=1, y=2, z=3$

$$(1)(2) + (1)(3) + (2)(3) \\ = 2 + 3 + 6 \\ = 11$$

$$(1)^2 + (2)^2 + (3)^2 \\ = 1 + 4 + 9 \\ = 14$$

aha!! they are not equivalent

**Action!**

## Equivalent Algebraic Expressions

Are the given functions equivalent?

$$f(x) = (2x - 1) + (x - 2) - (x - 3)$$

and

$$g(x) = (3x - 2) - (2x + 3) - (-x - 1)$$

Simplify!

$$\begin{aligned} f(x) &= \underbrace{2x}_{\text{green}} - \underbrace{1}_{\text{purple}} + \underbrace{x}_{\text{green}} - \underbrace{2}_{\text{purple}} - \underbrace{x}_{\text{green}} + \underbrace{3}_{\text{purple}} \\ &= \cancel{2x} + \cancel{0} \end{aligned}$$

$$\begin{aligned} g(x) &= \underbrace{3x}_{\text{green}} - \underbrace{2}_{\text{purple}} - \underbrace{2x}_{\text{green}} - \underbrace{3}_{\text{purple}} + \underbrace{x}_{\text{green}} + \underbrace{1}_{\text{purple}} \\ &= \cancel{2x} - 4 \end{aligned}$$

the expressions are not equivalent!

## Consolidation

### Partner Challenge

1. Create 3 algebraic expressions
  - Make sure 2 are equivalent and one is not
2. Exchange algebraic expressions to a partner
3. Race to figure out which are equivalent
